When they are awake,  
however, fetuses are often  
active, practicing their  
reflexes in response to  
provocations from outside  
the womb. These include the  
startle reflex, when the  
fetus flings her arms out  
and over her head, and the  
swallowing and sucking  
process, crucial to  
nutrition outside of the  
womb.

## Key

It appears that the relationship between fetal movement and neonatal behavior is inconsistent. Fetal activity did appear to predict temperament related to self regulatory behaviors in early childhood. Small positive associations were detected between motor behavior at 36 weeks gestation and neonatal irritability and motor development.
