Internet Protocol Version 4 (IPv4) Internet Protocol is one of the
major protocols in the TCP/IP protocols suite. This protocol works
at the network layer of the OSI model and at the Internet layer of
the TCP/IP model. Thus this protocol has the responsibility of
identifying hosts based upon their logical addresses and to route

data among them over the underlying network. IP provides a mechanism to uniquely identify hosts by an IP addressing scheme.

Internet Protocol version 4 is the fourth version of the Internet

Protocol. It is one of the core protocols of standards-based internetworking methods in the Internet and other packet-switched networks. IPv4 was the first version deployed for production on SATNET in 1982 and on the ARPANET in January 1983. It still routes most Internet traffic today, despite the ongoing deployment of a successor protocol, IPv6. IPv4 uses a 32-bit address space which provides 4,294,967,296 unique addresses, but l
